ЗАПРЕМИНСКЕ И СОРТИМЕНТНЕ ТАБЛИЦЕ ЗА БУКВУ (*Fagus moesiaca* /Domin, Mally/Czeczott.) У РЕПУБЛИЦИ СРБИЈИ

Аутори запреминских таблица

др Станиша Банковић, ред. проф. у пензији, Универзитет у Београду Шумарски факултет
др Милан Медаревић, ред. проф. у пензији, Универзитет у Београду Шумарски факултет

Аутор сортиментних таблица

др Војислав Бајић, ред. проф. у пензији, Универзитет у Београду Шумарски факултет

Насловна страна: Стабло мезијске букве - Мајданпечка Домена, североисточна Србија

Идејно решење: PRINT ART STUDIO

Предговор

Један од основних задатака при планирању и примени интегралног информационог система о шумама Србије је примена јединствене методологије инвентуре шума. У веома широком спектру информација о састојини (одсеку), као основној јединици малоповршинског газдовања шумама, које се примењује у нашој и већини европских земаља, значајно место заузимају и информације о структурној изграђености састојина, као и информације о вредностима основних таксационих елемената на јединици површине: броју стабала, темељници, запремини, запреминском прирасту итд. На основу свих досадашњих искустава показало се, да би се обезбедила тражена тачност при одређивању запремине и запреминског прираста од $\pm 8\%$, да је неопходно да се располаже и са довољно поузданим и тачним запреминским таблицама и тарифама. Поуздана основа за све нивое планирања су, поред запреминских таблица, и сортиментне таблице (сортиментне таблице до сада нису рађене за шуме Србије). Стога се израда нових запреминских, као и сортиментних таблица за главне врсте дрвећа у Србији може сматрати једним од главних задатака којим се заокружује један од најсложенијих научно - истраживачких пројеката о стварању, разради и примени новог система савременог планирања газдовања шумама и шумским подручјима.

Посебно треба истаћи да се израдом сортиментних таблица за све главне врсте дрвећа у Србији пружа могућност за егзактно установљење сортиментне структуре у састојини, што даје низ предности организацији која газдује шумом. То се превасходно односи на то да се применом сортиментних таблица на најједноставнији и најбржи, уз то и најобјективнији начин, долази до вредности дозначене дрвне запремине, као и укупне вредности шума. Ова методологија при одређивању сортиментне структуре нарочито ће добијати на значају, поред наведеног, у случајевима припреме за оглашавање јавног надметања дозначене дрвне запремине на пању, што је у многим европским земљама уобичајена пракса.

Важност - употребљивост запреминских таблица, на основу досадашњих научних и стручних сазнања, износи највише тридесет година. После истека овог временског периода обавезно се приступа ревизији старих (важећих) или изради нових запреминских таблица. Запреминске таблице за већину главних врста дрвећа у Србији израђене су пре тридесет до педесет година, те се њиховом употребом прави знатна грешка при одређивању запремине и запреминског прираста при инвентури шума. У сврху повећавања тачности инвентуре шума, поред сталног побољшавања метода инвентуре шума, неопходно је израдити нове запреминске таблице за све главне врсте дрвећа у Србији.

Запреминске и сортиментне таблице за букву настале су као резултат пројекта чију је израду финансирао ЈП за газдовање шумама 'Србијашуме' Београд. Израђене таблице са извештајем по пројекту, предате су наручиоцу пројекта.

Аутори

Основни материјал

Како станишне и састојинске прилике у Србији (два најутицајнија фактора који утичу на облик, запремину, а тиме и на сортиментну структуру стабала) карактерише велика хетерогеност, и то на малом простору, то се при прикупљању неопходних података за израду таблица мора водити рачуна о тзв. површинској репрезентативности, односно о томе да се подаци прикупе у свим еколошким јединицама у којима се јавља конкретна врста дрвећа, као и у различитим састојинским ситуацијама: састојине различитих степена очуваности, различитих развојних фаза, структурне изграђености итд. Поред исправног структурирања основног материјала – узорка, нужна претпоставка за израду поузданих таблица јесте и величина узорка. Таблице морају да се базирају на довољном броју података, како би биле репрезентативне за истраживано подручје, односно како би резултати добијени на основу њих били у границама дозвољене тачности. У том смислу, за израду локалних запреминских таблица, коришћени су подаци добијени на основу премера минимум 500 стабала, а репрезентативност сваког узорка испитивана је по принципима варијационе статистике. У складу са тим резултатима, поменути број може бити довољан (репрезентативан) за одређени локалитет или не. Уколико узорак није био репрезентативан, било је потребно повећати узорак до минимално потребног броја стабала.

Шумска подручја у којима су прикупљани подаци за запреминске и сортиментне таблице за букву су: јужноморавско, јабланичко, нишавско, моравско, топличко, тимочко, севернокучајско, јужнокучајско, расинско, доњеибарско, горњеибарско, голијско, подрињско, колубарско.

Структура основних података према шумским газдинствима и пореклу састојина

Третман		Порекло		укупно
		изданачке	високе	
А	Бољевац	94	287	381
	Деспотовац	---	509	509
	Кучево	---	453	453
Укупно		94	1.249	1.343
В	Крушевац	---	493	493
	Краљево	---	462	462
	Крушевац	---	328	328
	Рашка	---	451	451
Укупно		---	1.734	1.734
С	Лозница	74	435	509
	Ужице	215	433	648
	Пријеполје	434	120	554
	Ивањица	306	528	834
Укупно		1.029	1.516	2.545
D	Пирот	56	399	455
	Ниш	191	182	373
	Лесковац	210	373	583
	Врање	280	211	491
	Куршумлија	9	346	355
Укупно		746	1.511	2.257
УКУПНО		1.869	6.010	7.879
		Елиминисано 211 стабала		8.090

Посебно треба нагласити да су све основне податке за израду запреминских и сортиментних таблица прикупили шумарски инжењери и техничари запослени у Јавном предузећу за газдовање шумама 'Србијашуме' Београд.

1.0 НАЧИН ИЗРАДЕ

ДВОУЛАЗНИХ ЗАПРЕМИНСКИХ ТАБЛИЦА

Подаци за израду запреминских таблица прикупљени су по уобичајеној методологији, применом секционог метода, при чему се вретено (дебло) стабла мерило по секцијама дужине 2 m, а грађевина по секцијама дужине 1m – у оба случаја за пречнике изнад 3 cm дебљине.

Запремина вретена стабла обрачуната је преко сложене Смалијанове формуле, а запремина грађевине по простој Хуберовој формули. За моделовање везе типа $V=f(d,h)$ примењена је (углавном) Шумахер – Халова функција, чији се квалитет цени по основним показатељима регресионе и корелационе анализе. Степен употребљивости израђених таблица испитује се помоћу моделних стабала, и то на два начина: на основу величине процен-туалних разлика између табличних и стварних запремина ових стабала, као и на основу статистичке значајности разлика њихових запремина, утврђене применом t-теста.

На основу пробне обраде свих података и примењених статистичких тестова констатоване су статистички значајне разлике по запремини стабала букве високог порекла између појединих подручја у Србији. Ради што тачнијих запреминских таблица одустало се од јединствених запреминских таблица за букву у Србији, него је извршено груписање, односно по хомогености материјала (запремини стабала) издвојена су четири подручја, и то:

- Источна Србија (А), која обухвата шумска газдинства Бољевац, Деспотовац и Кучево;
- Централна Србија (Б), која обухвата шумска газдинства Крушевац, Краљево, Крагујевац и Рашка;
- Западна Србија (Ц), која обухвата шумска газдинства Лозница Ужице, пријеполје и Ивањица;
- Јужна Србија (Д), која обухвата шумска газдинства Пирот, Ниш, Лесковац, Врање и Куршумлија.

Код запремине стабала букве изданачког порекла нису нађене статистички значајне разлике, те су за букву изданачког порекла конструисане **Јединствене запреминске таблице на нивоу целе Србије.**

Изравнавања основних података (регресиона анализа) извршена су по **ШУМАХЕР – ХАЛОВОЈ** функцији. Резултати ових изравнавања, односно добијене функције за високе (у четири региона) и изданачке шуме букве, као основ за конструкцију двоулазних запреминских таблица, дате су у наредном прилогу:

БУКВА ВИСОКОГ ПОРЕКЛА

**А – БОЉЕВАЦ, ДЕСПОТОВАЦ И КУЧЕВО
(ИСТОЧНА СРБИЈА):**

$$\nu = 0,00004 \cdot d^{2,05840} \cdot h^{0,96443}$$

**Б- КРУШЕВАЦ, КРАЉЕВО, КРАГУЈЕВАЦ И РАШКА
(ЦЕНТРАЛНА СРБИЈА):**

$$\nu = 0,00006 \cdot d^{1,95285} \cdot h^{0,94036}$$

**Ц – ЛОЗНИЦА, УЖИЦЕ, ПРИЈЕПЉЕ И ИВАЊИЦА
(ЗАПАДНА СРБИЈА):**

$$\nu = 0,00006 \cdot d^{1,88652} \cdot h^{0,97552}$$

**Д – ПИРОТ, НИШ, ЛЕСКОВАЦ, ВРАЊЕ И КУРШУМЛИЈА
(ЈУЖНА СРБИЈА):**

$$\nu = 0,00005 \cdot d^{1,98222} \cdot h^{0,94918}$$

**БУКВА ИЗДАНАЧКОГ ПОРЕКЛА
(ЈЕДИНСТВЕНЕ ТАБЛИЦЕ ЗА СРБИЈУ):**

$$\nu = 0,00005 \cdot d^{1,85940} \cdot h^{1,03464}$$

2.0 НАЧИН ИЗРАДЕ ВИСИНСКО-БОНИТЕТНИХ СНОПОВА (ВИСИНСКИХ ТАБЛИЦА)

Као основ за израду тарифа (једноулазних запремнинских таблица са више низова запремина) је конструкција висинско-бонитетних снопова са више низова висинских крива (висинских таблица. Изравнавање висинских крива извршено је по функцији **ПРОДАНА**. Добијене вредности праметара висинских крива за високе и изданаčke састојине букве дате су следећем прегледу:

БУКВА ВИСОКОГ ПРЕКЛА

А- БОЉЕВАЦ, ДЕСОТОВАЦ И КУЧЕВО:

$$h = \frac{d^2}{1,07869 + 0,34555 \cdot d + 0,03299 \cdot d^2} + 1,30 \quad R^2 = 0,589 \quad s_h = 0,010$$

Б – КРУШЕВАЦ, КРАЉЕВО, КРАГУЈЕВАЦ И РАШКА:

$$h = \frac{d^2}{3,90090 + 0,46591 \cdot d + 0,02576 \cdot d^2} + 1,30 \quad R^2 = 0,592 \quad s_h = 0,013$$

Ц – ЛОЗНИЦА, УЖИЦЕ, ПРИЈЕПОЉЕ И ИВАЊИЦА:

$$h = \frac{d^2}{2,00170 + 0,38303 \cdot d + 0,02593 \cdot d^2} + 1,30 \quad R^2 = 0,710 \quad s_h = 0,009$$

Д – ПИРОТ, НИШ, ЛЕСКОВАЦ, ВРАЊЕ И КУРШУМЛИЈА:

$$h = \frac{d^2}{0,04940 + 0,56425 \cdot d + 0,02613 \cdot d^2} + 1,30 \quad R^2 = 0,536 \quad s_h = 0,010$$

БУКВА ИЗДАНАЧКОГ ПОРЕКЛА - СРБИЈА -

$$h = \frac{d^2}{1,20240 + 0,33296 \cdot d + 0,03278 \cdot d^2} + 1,30 \quad R^2 = 0,618 \quad s_h = 0,008$$

На основу изравнатих вредности висинских (датих у претходном прегледу) по методу **БАНКОВИЋ – МИТРОВИЋ** конструиcани су висинско- бонитетни снопови, односно висинске таблице за високе и изданаčke састојине:

2.1 ВИСИНСКЕ ТАБЛИЦЕ ЗА БУКВУ (ВИСОКЕ ШУМЕ) – ИСТОЧНА СРБИЈА

**СОРТИМЕНТНЕ ТАБЛИЦЕ ЗА БУКВУ
(*Fagus moesiaca* /Domin, Mally/Czeczott.)
У РЕПУБЛИЦИ СРБИЈИ**

4.0 НАЧИН ИЗРАДЕ СОРТИМЕНТНИХ ТАБЛИЦА

Од укупно прикупљених података за 8.090 стабала оба узгојна облика, укупно њих 211 није одговарало по квалитету за израду запреминских таблица. Од преосталих 7.879 стабала која су укључена у поступак израде запреминских таблица, морали смо из различитих разлога, из обраде за израду сортиментних таблица искључити још 329 стабала, што је укупни број стабала из оба узгојна облика свео на 7.550.

Приликом израде сортиментних таблица коришћени су одговарајући математичко статистички методи, пре свих метод корелационе и регресионе анализе.

Критеријум за избор функција која изравнавају податке базирао је на емпиријским искуствима – природе тока раста или опадања учешћа појединих сортимената у укупној дрвној запремини у зависности од две варијабле: $d_{1,3}$ и h , као и принципу да исказана корелациона веза између променљивих, мора бити најмање средње јака, да би се изабрана функција могла прихватити и укључити у даљи рад.

Полазећи од ових критеријума, у току рада смо наилазили на изазове различите природе. Највећи од њих је био тај, да у већини извршених анализа за сортименте чије је учешће у укупној дрвној запремини иначе мало (F, L и K), није било могуће квалитетно изравнати податке по свим стратумима, који су на почетку обраде података означени као јединствени статистички скупови.

Покушај да се изврше обједињавања података за два, па некад и за три сродна сортимента по квалитету, најчешће је давао функције са квалитетним елементима оцене, али би такав приступ (то је била наша оцена), довео до проблема у вођењу евиденција на терену, а и у пословним књигама.

У настојању да се настали проблеми преброде, рачунајући на природу зависности, а у жељи да резултати буду у складу са уложеним напором, увели смо још један критеријум за разврставање прикупљених података. То је **техничка класа**. Сва стабла из узорка су после кројења, по квалитету израђених сортимената сврстана у једну од три техничке класе: **А**, **Б** или **Ц класу**.

Приликом формирања техничких класа, руководили смо се искуствима истраживача који су се бавили овим питањима, као и потребама са једне и њиховој практичној применљивости, са друге стране. Критеријуми за формирање техничких класа дати су у наставку.

Из наведеног разлога се приступило формирању нова три скупа за високе шуме букве у Србији, где је критеријум за сврставање био припадност одговарајућој техничкој класи.

Приликом завршне анализе, водило се рачуна да се наведени критеријуми у потпуности задовоље. Како се наишло на околност је да број најтањих стабала, разврстан по техничким класама недовољан за квалитетну анализу, приступило се још једном обједињавању података. Ради повећања репрезентивности узорка, а имајући у виду квалитет, као и то да се од стабала тих димензија могу добити само сортименти из категорије „просторно дрво“, сва

стабла чији је пречник у прсној висини био 13 cm и мањи, обједињена су у новоформирани скуп, који је у обради третиран на исти начин као и остали. Усвојене једначине регресије коришћене су за установљење процентуалног ушешћа просторног дрвета и дрвног остатка за стабла чији су прсни пречници од 7 до 13 cm, јединствено за све три техничке класе квалитета.

Приликом изравнавања података о зависности ушешћа просторног дрвета, техничке облице и дрвног остатка, засебно су изравнавани подаци по техничким класама за стабла пречника до 26 cm и преко 26 cm. Овакав приступ условила је природа тока зависности.

Сва узоркована стабла из изданаčkih шума су сврстана у јединствен статистички скуп за целу територију Србије.

Нажалост, приликом обраде тих података, није било могуће установити одговарајуће корелационе везе за све сортименте, које би задовољиле усвојене критеријуме. Из тог разлога смо код овог узгојног облика одступили од принципа и приликом регресионе анализе објединили F, L и K класу у јединствен скуп и тако га обрадили.

Приликом анализе су се користили, а и у наставку извештаја ће се користити одређени симболи, чије је значење:

- F%	Процентуално учешће фурнирских трупаца у бруто запремини стабла;
- L%	Процентуално учешће трупаца за љуштење у бруто запремини стабла;
- K%	Процентуално учешће кладарки у бруто запремини стабла;
- Ikl%	Процентуално учешће трупаца за резање прве класе у бруто запремини стабла;
- IIkl%	Процентуално учешће трупаца за резање друге класе у бруто запремини стабла;
- IIIkl%	Процентуално учешће трупаца за резање треће класе у бруто запремини стабла;
- UTO%	Процентуално учешће техничког дрвета у бруто запремини стабла;
- To%	Процентуално учешће техничке облице у бруто запремини стабла;
- Pr%	Процентуално учешће просторног дрвета у бруто запремини стабла;
- SumaPr%	Процентуално учешће укупног просторног дрвета у бруто запремини стабла;
- Ostatak%	Процентуално учешће дрвног остатка у бруто запремини стабла;

Као резултат извршених анализа, за израду сортиментних таблица одабране су следеће функције, уз које су дати и њихови коефицијенти детерминације и стандардне грешке регресије:

$R^2 = 72,56\%$
 $St. err. = 4,99$

$Ostatak\% = -0,542882 + 165,842 / d + 210,848 / h$

$R^2 = 74,33\%$
 $St. err. = 4,49$

Процентуално учешће укупног просторног дрвета установљено је као допуна до сто процената збира процентуалног учешћа УТО и Остатка за сваки дебљински степен, а процентуално учешће просторног дрвета као разлика процентуалног учешћа укупног просторног дрвета и процентуалног учешћа То.

Израђене сортиментне таблице се односе на стабло, што значи да оне дају могућност за установљење процентуалног учешћа сортиментних класа у укупној запремини конкретног стабла.

После израчунавања бруто запремине сваког узоркованог (дозначеног) стабла, које треба вршити према новоизрађеним запреминским таблицама, а које је у току узорковања (дознаке) сврстано у одговарајућу техничку кла-

су, треба израчунати учешће сортиментних класа на основи његове бруто дрвне запремине (установљене из одговарајућих запреминских таблица) и проценуалног учешћа сортимената за одговарајући пречник у прсној висини стабла (из одговарајућих сортиментних таблица). У наставку ће се дати два примера обрачуна.

Претпоставимо да стабло пречника у прсној висини 45 см има бруто запремину 2,01 m³ и према датим критеријумима припада техничкој класи А, тада има:

- трупаца класе F	4,92%	или	0,1 m ³
- трупаца класе L	16,79%	или	0,34 m ³
- трупаца класе K	7,14%	или	0,14 m ³
- трупаца I класе	17,41%	или	0,35 m ³
- трупаца II класе	10,54%	или	0,21 m ³
- трупаца III класе	6,63%	или	0,13 m ³
- техничке облице	1,39%	или	0,03 m ³
- просторног дрвета	20,81%	или	0,42 m ³
- дрвног остатка	14,23%	или	0,29 m ³

Претпоставимо такође да стабло букве из изданачке састојине, чији је пречник у прсној висини 40 см, има бруто запремину од 1,24 m³, тада се може очекивати:

- трупаца класе FL и K	1,79%	или	0,02 m ³
- трупаца I класе	3,77%	или	0,05 m ³
- трупаца II класе	17,62%	или	0,22 m ³
- трупаца III класе	16,22%	или	0,20 m ³
- техничке облице	8,26%	или	0,10 m ³
- просторног дрвета	39,71%	или	0,49 m ³
- дрвног остатка	12,62%	или	0,16 m ³

4.2 УПУТСТВО

за класификовање стабала букве у техничке класе

Сортиментне таблице за букву су рађене као троулазне, где су поред пречника у прсној висини дозначеног стабла и процентуалног учешћа појединих сортимената у укупној дрвној запремини стабла, улаз и припадност тог стабла одговарајућој техничкој класи квалитета.

Руводећи се, између осталог, принципом целисходности и практичне применљивости, сва стабла високих шума букве у Србији су сврстана у три техничке класе по квалитету:

- техничку класу **A**,
- техничку класу **B** и
- техничку класу **C**.

Класификовање стабала у техничке класе врши се приликом дознаке, и подаци се уносе на одговарајуће место у дозочној књижици. Да би успешно могао да изврши класификацију сваког појединачног стабла у одговарајућу техничку класу, дозначар мора да познаје одредбе СРПС (Српски стандард) за трупце букве. Приликом сврставања, сва стабла се групишу у она чији је пречник у прсној висини до 30 cm и она пречника преко 30 cm.

У класу квалитета A сврставају се:

Сва стабла чији је пречник у прсној висини до 30 cm, а здрава су и права, пунодрвна, чиста од грана најмање до једне трећине њихове висине.

Сва стабла чији је пречник у прсној висини преко 30 cm, а здрава су и права, пунодрвна до једне трећине њихове висине, од чије се прве петине дужине дебла могу израдити трупци чији је квалитет у класи F, L, K и I кл.

У класу квалитета B сврставају се:

Сва стабла чији је пречник у прсној висини до 30 cm, код којих није отпочео процес чишћења од грана, имају вишеструку или велику једноструку закривљеност, усукана су или јаче деформисана у приданку.

Сва стабла чији је пречник у прсној висини преко 30 cm, од чијег се дебла и грана, поред просторног дрвета, могу израдити једино трупци за резање квалитета III кл.

У класу квалитета C сврставају се:

Сва стабла која нису сврстана ни у једну од две претходно описане класе квалитета.
